

Solar System song by Emma

There are 8 planets in the solar system,
Which revolve around the sun.

Join me to learn about the different planets,
Sing along and have some fun.

First up is Mercury, he is the second hottest planet,
The nearest one to the sun.

For him, a year is only 88 days,
But he is still is lots of fun.

Next up is Venus, He is the hottest planet,
The second one from the sun.

He is the brightest planet in the solar system,
He is too hot for anyone.

Next is Earth, he is the planet we live on,
The third on from the sun.

He is the only planet with organic life,
So, take care but still have fun.

Next is Mars, he is red and rocky,
The fourth planet from the sun.

He has a massive mountain in his planet,
Even bigger than Earths largest one.

Next up is Jupiter, he is covered in clouds,

He is the fifth planet from the sun.

His gigantic red dot is a raging storm,

As for size he is the biggest one.

Next is Saturn, he is brown in colour,

The sixth planet from the sun.

His outer rings are thin,

They are made of dust and icy chunks.

Next ups Uranus, he is always sideways,

He is the seventh planet from the sun.

Humans have named him the icy planet,

Because he is the coldest one.

Last is Neptune, he is blue in colour,

The eighth planet from the sun.

He has too many storms in his atmosphere,

He's the furthest one from the sun.
